

# Monitor.

FireM is a Real Time Fire Monitoring Solution that transforms any standard Fire Indicator Panel into a Smart fire System.

FireM interfaces to any Fire Indicator Panel, is suitable for any application, and provides benefits to all stakeholders. Using IoT technology, FireM securely captures and stores all data from the FIP and displays in both cloud platform & mobile application.

### **Any Panel • Anywhere • All the time**

FireM uses advanced analytics to reduce maintenance costs through improved reporting and streamlined routine testing & inspection activities.

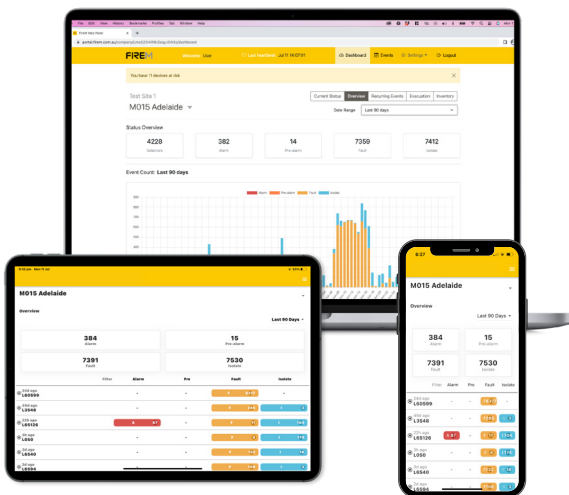

FireM users have access to the web console and mobile app, providing real time visualisation of alarms, pre-alarms, faults and isolations.

System software is configurable to site specific conditions, including predictive alerts (via app, text, and email) for pro-active maintenance.

FireM reduces risk, enables faults to be rectified before escalation and can prevent building evacuations.

# Review.

**RETAINS ALL DATA FOR LIFE**

Through FireM's real-time dashboards and web console, users take advantage of modern IoT technology to monitor their fire safety assets and better protect their properties.

Recurring events are autonomously identified and notified.

These enhanced features allow data driven decision making, independent cost verification, quick remedial action to be taken, and executive risk mitigation

**FIREM TECHNOLOGY ALSO:**

- Improves testing and maintenance reporting, replacing the need for imprecise manual (and often written) reporting;
- Provides accountability around fire and life safety compliance costs for facility managers and building owners;
- Indicates comprehensive, independently verifiable mitigation of risk to occupants, asset managers, building owners and their insurers; and
- Reduces labour for Inspections with the ability to eliminate the need for a technician at the panel

# Notify.

FireM is subscription based and includes an easy-to-use mobile application, suitable for both Android and Apple IOS.

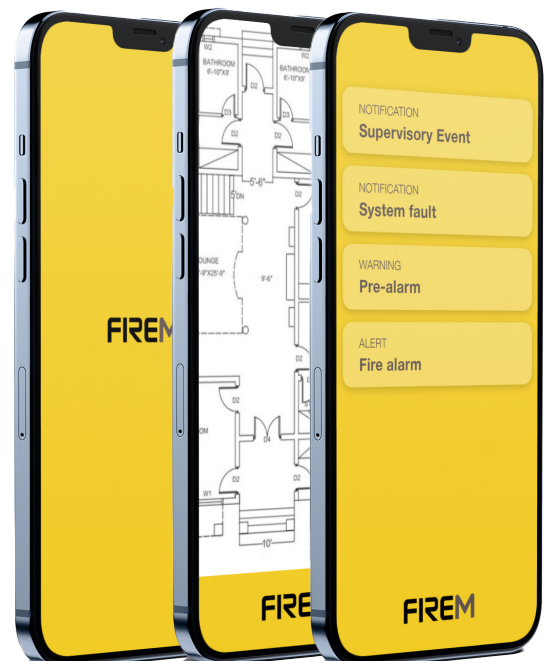

FireM is a fire panel in the palm of your hand.

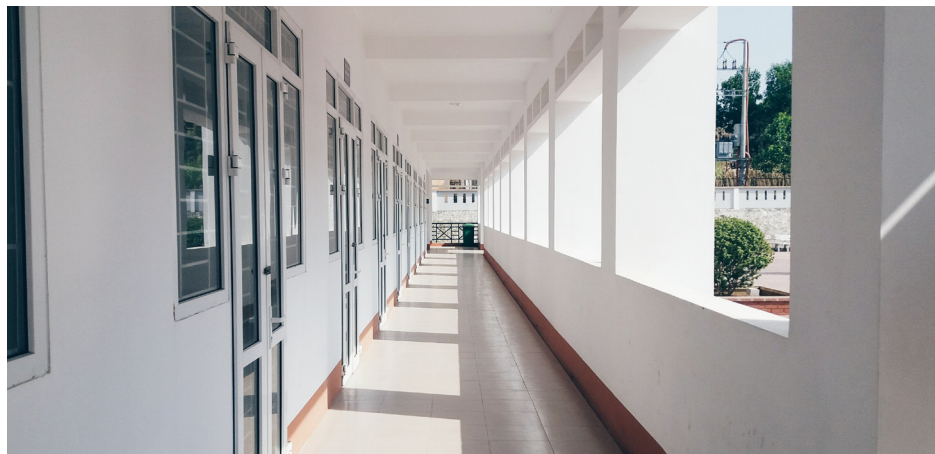

All FIP notifications are displayed on the mobile phone in real time.

An easy-to-program mapping function is included within the subscription, replacing the need for expensive and complex mapping systems.

FireM allows users to visualise data and quickly make decisions that can:

- Prevent building evacuations
- Reduce Risk
- Increase maintenance efficiency
- Save lives

# Applications.

- Aged Care
- Commercial office towers
- Defence
- Govt. Buildings
- Hospitals
- Hotels & Resorts
- Manufacturing Facilities
- Mining & Industrial
- Remote monitoring
- Residential
- Retail
- Schools and Universities
- Software and Data Analytics
- Supermarkets
